

Riparian Health Action Plan (RHAP)

**Integrated Watershed
Management Plan
for the North
Saskatchewan River
in Alberta**

North Saskatchewan Watershed Alliance

Indicators of Watershed Health

Metrics chosen for the State of the North Saskatchewan Watershed Report.

Indicator Category	Metric
Land Use	Riparian health
	Linear development (roads, seismic, pipelines, etc.)
	Land use inventory
	Livestock density
	Wetland inventory
Water Quality	Surface water quality index (AENV model)
	<i>E. coli</i>
	Phosphorus (TP, SRP)
	Pesticides
Water Quantity	Water allocations by sector
	Groundwater extraction
Biological Indicator	Aquatic macrophytes
	Fish (population estimates)
	Vegetation types (Alberta Vegetation Inventory)
	Benthic invertebrates

Riparian Importance

Ecological Functions: Riparian areas support the health of the ecosystem.

 <p>Traps and stores sediment</p>	 <p>Builds and maintains banks and shorelines</p>	 <p>Stores water and energy</p>	 <p>Recharges aquifers</p>
 <p>Filters & buffers water</p>	 <p>Reduces and dissipates energy</p>	 <p>Promotes plant growth</p>	 <p>Maintains biodiversity</p>

Riparian Areas in the IWMP

Watershed Management Direction 3.3: Maintain and restore riparian areas

Actions:

3.3.1

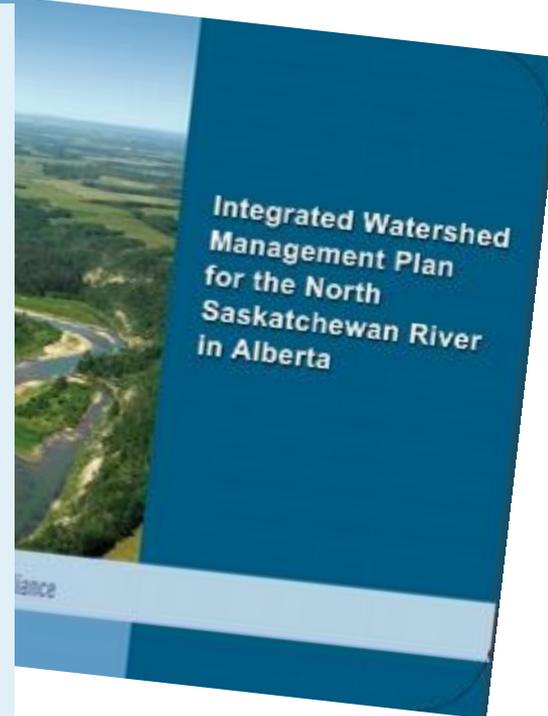

Complete an inventory and assess the condition of riparian areas in the NSR watershed.

3.3.2

Municipalities, in consultation with landowners groups and other stakeholders, are encouraged to develop riparian set-back guidelines which exceed provincial regulations.

3.3.3

Develop incentive and support programs (financial and expertise) to enable and assist landowners to retain naturally-occurring riparian areas, restore damaged riparian areas and replant riparian vegetation on their own land.

Riparian Strategy (Draft)

“Riparian lands in the North Saskatchewan watershed are recognized as critical for protecting our source waters and for maintaining the water quality, quantity and aquatic health of the North Saskatchewan River and its tributaries, as well as other waterbodies (lakes, wetlands, etc.) in the watershed. As such, riparian areas are identified and protected from the risks associated with development”

5. Riparian Literature Review

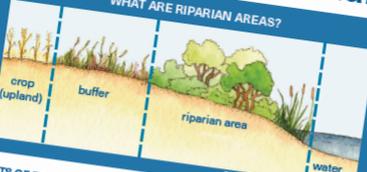

RHAP Communication Material

Riparian Health Action Plan

Riparian areas are the transitional green zones between waterbodies and their uplands. They are home to unique soils, plants and animals.

WHAT ARE RIPARIAN AREAS?

Graphic courtesy of Cows & Fish

BENEFITS OF RIPARIAN AREAS

- Improve water quality** by trapping sediments, filtering nutrients and pollutants, reducing enrichment that leads to increased aquatic plant and algal growth
- Mitigate floods and droughts** by storing and allowing the release of water and reducing erosion
- Improve biodiversity** by providing fish and wildlife habitat and cooling water temperatures
- Provide aesthetically pleasing areas** for recreation or cultural activities
- Add economic value** by increasing property values or providing areas for nature viewing.

Why has the NSWA taken action on riparian areas?

THE ISSUE: Of the 100,000 km of riparian areas throughout the North Saskatchewan River watershed, less than 1% of its condition was known.

- As urban and agricultural development progress, riparian areas play an increasingly important role in protecting water quality and watershed health.
- While "boots-on-the-ground" field research is critical and can never be replaced, the group recognized the usefulness of remotely-sensed data for large-scale riparian area assessment. These two methods are complementary.

CREATING THE RIPARIAN HEALTH ACTION PLAN

This led to a 3-Phase NSWA project to create maintain and restore riparian conditions.

- Phase 1** Create an inventory using satellite imagery that assesses the overall condition of riparian areas in the NSR watershed.
- Phase 2** Collaborate with local municipalities and landowners to develop riparian bylaws and guidelines that complement provincial regulations.
- Phase 3** Support programs that enable and assist landowners to retain, restore and replant riparian vegetation on their own land.

Issue: January, 2020/ Page 1

PHASE 1: COLLECTING AND ASSESSING THE DATA

THE 3 TYPES OF DATA COLLECTED WERE:

- Intactness of the existing riparian areas
- Pressure on riparian health from adjacent upland areas (human or natural)
- The combined Intactness x Pressure scores = Conservation or Restoration priorities

A RIPARIAN INTACTNESS SCORES

Intactness refers to the extent to which natural riparian habitat has been altered by human activity. Using satellite imagery, the assessment focused on how much natural and woody vegetation remain along shorelines of creeks and lakes.

Close-up of intactness satellite data

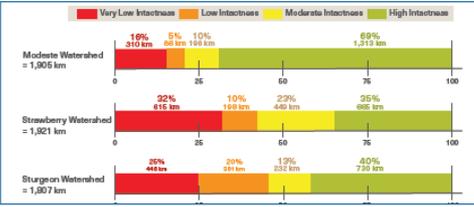

- near** Vegetation present. Little or no human footprint.
- moderate** Vegetation present. Some human footprint.
- low** Vegetation limited. Human footprint prevalent.
- very low** Vegetation mostly clear. Human footprint dominant.

PILOT PROJECT AREA

In 2016, The NSWA piloted a project in which a new watershed-scale assessment method was developed by a consultant. This method uses high-resolution satellite data to evaluate condition. This method has now been evaluated by the Government of Alberta.

Watershed	Very Low Intactness	Low Intactness	Moderate Intactness	High Intactness
Modeste Watershed = 1,005 km	19% (190 km)	5% (50 km)	10% (100 km)	69% (685 km)
Strawberry Watershed = 1,821 km	32% (585 km)	10% (180 km)	22% (400 km)	35% (635 km)
Sturgeon Watershed = 1,007 km	25% (250 km)	29% (290 km)	12% (120 km)	40% (400 km)

Many project partners and stakeholders helped fund the data collection:

Page 2

Summary of the Modeste Watershed Riparian Area Assessment Report

Riparian lands are transitional areas between water and the surrounding land and are important because they:

- Improve water quality by filtering harmful nutrients and pollutants
- Mitigate issues like flood, drought and erosion
- Create biodiversity and provide habitat for birds, fish, and wildlife
- Provide recreational & aesthetic areas
- Add economic value to property

As urban and agricultural development progress, riparian areas play an increasingly important role in protecting water quality and watershed health.

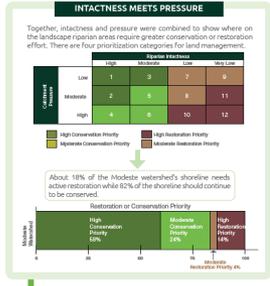

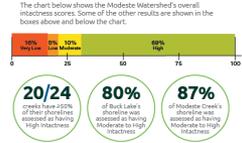

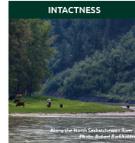

ISSUE: Of the 100,000 km of riparian areas throughout the North Saskatchewan River watershed, less than 1% of its condition was known.

RESPONSE:

- Field-based research can never be replaced, but a complementary satellite imagery method provides a faster way to assess large areas for riparian conditions.
- This newly developed method called "riparian intactness" has been used by NSWA and other watershed councils large scale projects in the province.

PURPOSE:

- Identify and target riparian areas for conservation and restoration
- Note areas that may need more site-specific assessments
- Provide overview of the condition of riparian areas for specific waterbodies, municipalities or subwatersheds

- ACTION ITEMS TO CONSERVE AND RESTORE RIPARIAN AREAS:**
- 1 Educate and encourage stewardship of riparian habitats
 - 2 Develop policies at the municipal level for land management
 - 3 Provide monetary incentives for private landowners to conserve riparian habitats
 - 4 Secure and conserve riparian habitats through land trusts or conservation groups

Summary of the Strawberry Watershed Riparian Area Assessment Report

Riparian lands are transitional areas between water and the surrounding land and are important because they:

- Improve water quality by filtering harmful nutrients and pollutants
- Mitigate issues like flood, drought and erosion
- Create biodiversity and provide habitat for birds, fish, and wildlife
- Provide recreational & aesthetic areas
- Add economic value to property

As urban and agricultural development progress, riparian areas play an increasingly important role in protecting water quality and watershed health.

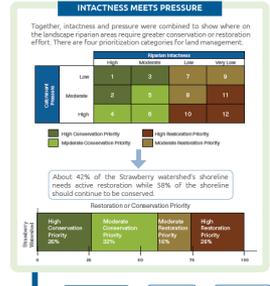

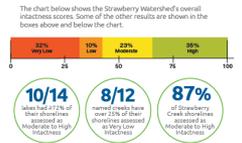

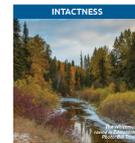

ISSUE: Of the 100,000 km of riparian areas throughout the North Saskatchewan River watershed, less than 1% of its condition was known.

RESPONSE:

- Field-based research can never be replaced, but a complementary satellite imagery method provides a faster way to assess large areas for riparian conditions.
- This newly developed method called "riparian intactness" has been used by NSWA and other watershed councils large scale projects in the province.

PURPOSE:

- Identify and target riparian areas for conservation and restoration
- Note areas that may need more site-specific assessments
- Provide overview of the condition of riparian areas for specific waterbodies, municipalities or subwatersheds

- ACTION ITEMS TO CONSERVE AND RESTORE RIPARIAN AREAS:**
- 1 Educate and encourage stewardship of riparian habitats
 - 2 Develop policies at the municipal level for land management
 - 3 Provide monetary incentives for private landowners to conserve riparian habitats

Sub-watershed Report Cards

Waterbody Report Card

Page 1

Page 2

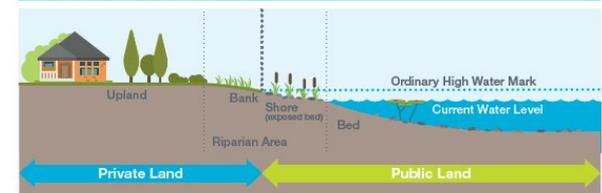

Why are riparian areas important?

- IMPROVE WATER QUALITY** by trapping sediments, filtering nutrients and pollutants, reducing enrichment that leads to increased aquatic plant and algal growth;
- MITIGATE FLOODS AND DROUGHTS** by storing and slowing the release of water and reducing erosion;
- IMPROVE BIODIVERSITY** by providing fish and wildlife habitat and cooling water temperatures;
- PROVIDE AESTHETICALLY PLEASING AREAS** for recreation or cultural activities; and
- ADD LOCAL ECONOMIC VALUE** by increasing property values or providing areas for nature viewing.

Where is a riparian area?

How can you improve the health of your riparian area?

- Leave your shoreline natural—don't remove any plants, grasses or aquatic vegetation as they all play an important role in keeping your lake healthy.
- If your shoreline has been cleared of vegetation, replant with native plants as much as possible and watch for invasive species. Report as appropriate.
- Learn more about the health of your riparian area
- For larger areas, create a management plan to improve the intactness of the riparian area over time
- More resources are available at [alberta.ca/search/riparian](#)

Template

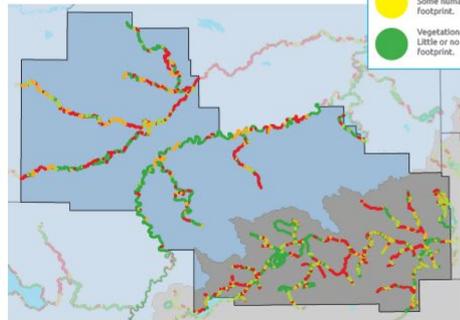

Municipal Report Card

LSA County: Intactness

What is Intactness?

- o Intactness is a measure of riparian condition at a broad scale (watershed or region)
- o Measures how natural habitat has been altered or impaired by human activity
- o Measures the quantity of natural, woody, and human footprint using satellite data

Intactness Results for LSA County

LSA County Intactness Overall

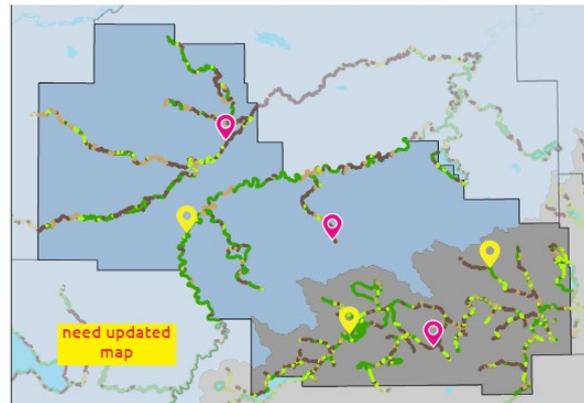

LSA County: Catchment Pressure

What is

- o Coarse indicator of what pressures exist on the landscape that impact riparian health

Conservation & Restoration Priorities: Within a watershed context

LSA's Top 3 Conservation & Restoration Priorities

- | | |
|---|--|
| <ul style="list-style-type: none"> • Lake: Sandy Lake • Named Creek: Toad Creek • Unnamed Creek: Unnamed Creek #15 | <ul style="list-style-type: none"> • Lake: Toad Lake • Named Creek: Kilini Creek • Unnamed Creek: Unnamed Creek #12 |
|---|--|

Next steps to conserve or restore impacted or impaired riparian habitats:

- 1 Educate and encourage stewardship of riparian habitats
- 2 Develop policies at the municipal level for land management
- 3 Provide monetary incentives for private landowners to conserve riparian habitats
- 4 Secure and conserve riparian habitats through land trusts or conservation groups

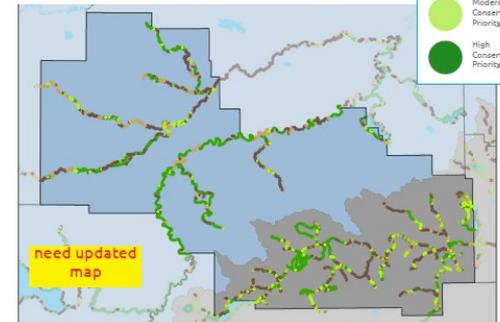

I added this. Thoughts?

LSA County: Prioritization

What is Prioritization?

- o Combines intactness scores and pressure scores to highlight which riparian areas are most affected by landscape pressures
- o Conservation efforts are prioritized where riparian intactness is high and landscape pressures are low
- o Restoration efforts are prioritized where riparian intactness is low and landscape pressures are high

Prioritization Results for LSA County

LSA County Prioritization Overall
